

Product Vision:

If we carefully observe the life of a consultant in any firm, we notice how they struggle through their multitasking where each of their task is high-demanding. Despite having a high pay, they decide to leave their job because of the worse work-life balance. In a short timespan meeting with the client which even can alter the company's revenue, the consultants' efficiency matters a lot. During or after the conversation, depending on the experience of the consultants, they usually take notes during the meetings or note down the key takeaways after the meeting and also the significant amount of numerical data which is pretty difficult to keep in memory. Multitasking like taking notes and solving client's issues with listening to every information they provide, the process becomes less efficient which eventually affects both the company and the clients, ultimately leads to the consultant's burnout due to inefficiency.

Introducing Kivi into the company's workflow can certainly help the process get more efficient. According to the will of consultants', they can either use Kivi during or after the meeting. Instead of taking manual notes and summarizing them with inconsistent data, with a click of a button in the keyboard of their devices Kivi will save the exact speech in the form of text and process it in a structured framework. The software will save and show both the exact transcript and the processed structured text so that the user can analyse the conversation later and also for quick actions they will just use the Kivi structured framework which is more automated.

Someone will choose to keep Kivi because of its easy accessibility and minimal complexity, mainly designed for the consultants and professional. After configuring their output styles, they will be able to receive their desired output script which they will be expecting best suits for them. By using Kivi, professionals perform efficiently in their work and they need not to worry about the mechanical works involved in the process which all will be taken care by Kivi. The Kivi will provide every kind of assistance in their own sort of way that is required for the professionals to interact more with the team and themselves after the meetings. They will quickly get to understand and recall what happened during the particular meeting by only seeing the script.

Focusing on the key functionality of Kivi, when user first starts the application, it will ask for a login and their role in any specific company, currently I have designed the application specifically for consultants, the interface will contain various flexible switches which is named with specific consultant's terminologies. The emphasizing and minimal UI of the application would not specifically bore the user but it will try to interact with the user with their own words. According to their will they are allowed to switch to any tone, language, output preview etc. For different scenarios during the meeting itself when the user suddenly changes their mind to change the settings, they can do so by simply navigating the side window bars. On startup of the devices Kivi will run automatically on the background and will have voice commands, suppose the user gives speech command as 'Hello Kivi' the record popup will appear and the application will ask if it should start the recording and live translation of speech to text. The notes can be manually altered according to the user's will. The Artificial Intelligence won't take control over any of the user's judgement as it will only show the output as per the user's commitment and saved settings.
